Nest Si	te Descrip	tion:	-	The nest i	s located o	on the gro	und on a	ın islan	d or flo	ating ve	getation. It i	S
			arge with the base composed of large sticks and lined with softer									
			l	material s	uch as par	oyrus tops	or grass	es.				
Clutch Size, Egg Description: Average clutch is 2 eggs, but can be from 1-6. Eggs												
Clutch	Size, Egg D	escription:	: /	Average c	lutch is 2 e	eggs, but o	an be fr	om 1-6	. Eggs a	re laid e	very 2-3 day	/S.

Incubation Period: 30-34 days

Fledgling Period: 60-85 days, but chick may

"fledge" to water at 30-45 days and continue to return to the nest daily until fully

fledging

Parental Care: Both parents incubate the eggs and care for the chicks. While the chick is very young,

one parent will always be at the nest, but as the chick ages, the parents will begin to

Maximum Group Size:

leave it alone at the nest for increasingly longer periods of time.

Chick Development: Chicks are altricial and born naked with eyes shut. They will eventually be covered in

white down. If more than one chick hatches in a nest, siblicide may occur.

CAPTIVE HABITAT INFORMATION:

Social Structure in the Wild: Gregarious

Social Structure in Captivity: Gregarious

3.3 for breeding, for

Minimum Group Size: non-breeding at least 3-

4 birds

As many as exhibit can

hold comfortably, try to

keep sex ratio even for

breeding

Compatible in

Mixed Species Exhibits:

Yes **Comments:**

Can be housed with other species of pelicans such as Great White Pelicans or Pink-backed Pelicans. Can also be housed in large exhibits with a variety of mammals, but require a place such as an island where they can escape. Horned mammals may

gore pelicans.

Optimal Habitat Size: Large pond with island or floating

barge or raft for nesting. Catch pen

for feeding birds is helpful.

Management Challenges: Siblicide-Can cross-foster additional eggs/chicks or hand-raise to prevent

siblicide.

Hospitalization-Birds do not do well under anesthesia.

Feet-Bumblefoot can occur; also if thorny acacia trees are present, thorns can

impale webbing on feet.

ADDITIONAL COMMENTS:

Dalmatian Pelicans in captivity are very tractable. They easily train to come into a catch pen to eat and some can be hand-grabbed for a medical procedure or move. During nesting, many of the birds will sit tight while the keeper procures the egg for candling or the chick for processing. In this case, proceed with caution and wear safety goggles as the bird may snap at you. Note that in the photos, both birds are shown in breeding plumage. The sexes are similar except that the female is smaller. In non-breeding plumage, the pouch and the skin around the eye is a dull yellow color and the feathers on the top of the head are very short.
